VOICE BASED EMAIL SYSTEM FOR VISUALLY IMPAIRED

Abstract:

Internet is one of the basic luxury for daily living. Every person is using the facts and information on internet. On the other hand, blind people face difficulty in accessing the text resources. The development in computer based handy systems has opened up numerous opportunities for the visually disabled across. Audio response based virtual environment, the screen readers are helps blind people a lot to use internet applications. This project introduces the Voicemail system structural design that can be used by a blind person to access E-Mails easily. The involvement of research is helping blind individual to send and receive voice based mails messages in their inhabitant language with the help of a computer.
